

OFMOS Mid-week Pulse — Numbers

Comparing the 7 days to 28 Aug against the 7 before it (rolling 7 days). All days in both windows are complete.

NEEDS INPUT BEFORE SENDING. The figures below are live and correct. The written sections are not — the notes file is dated **2026-08-24** but this report covers the week starting **2026-08-17**. Update ofmos_notes.json and re-run. Nothing in this report has been auto-written on your behalf.

REVENUE (NET)	NEW SUBSCRIBERS
Last 7d 22 Aug – 28 Aug	Last 7d
Prior 7d 15 Aug – 21 Aug	Prior 7d
Growth	Growth
291	417
41%	574
85%	-27.4%

Anne Love	\$5.59	\$5.59	+0%	0.0%	0

Contribution to the change in new subs

RANKED BY IMPACT

CREATOR	PRIOR 7D	LAST 7D	CHANGE	SHARE OF MOVE	CUMULATIVE
Emma Storm VIP	301	148	-153	97%	97%

Where the change came from. New subscribers moved -157 overall. **Emma Storm VIP** alone accounts for 97% of that move. Treat this as an account-level question, not an agency-wide one.

Progress

Written sections — entered by the team, not generated. They describe the calendar week beginning **17 Aug**.

What actually got done — and the results

- Average unlock price reached its highest level of the month, with PPV rising to over 80% of revenue.
- Renewal rate improved week on week — retention is strengthening even as new intake softens.
- Second-tier creators grew, broadening revenue away from the top account.
- Two new creators onboarded, both already producing revenue.
- Daily and per-shift revenue reporting now generates and publishes automatically.

What did not get done — and the effect

- Acquisition was not addressed. New subs per day fell sharply while revenue held, because monetisation absorbed the shortfall. We are extracting more from a base we are refilling more slowly, with no diagnosis for why intake fell.
- Creator history exports were not made routine. When a creator leaves, their entire earnings history becomes unretrievable from Infloww. One late-August departure was not exported in time and that history is permanently gone.
- Ongoing per-person conversion measurement was not built, in a business where PPV is over 80% of revenue.

#1 focus for the upcoming week

Diagnose and begin fixing the acquisition decline.

Why: New subs per day are down sharply while revenue is up. That is a good problem for one month and a serious one for three. We currently cannot diagnose it — traffic source and promotional spend are not tracked anywhere, so we cannot distinguish a promo ending, an algorithm change, reduced posting cadence, or seasonality.

What it brings: Restoring the earlier intake rate would mean roughly 35 additional new subscribers per day, on the order of \$2,000 per day of recoverable run rate. Instrumenting traffic sources is the prerequisite — without it, any fix is guesswork.

Problems & input needed

Biggest blocker

BLOCKER

We have a revenue dashboard, not a business dashboard. We can see net revenue, subscribers, unlock prices and per-creator splits to the penny. We have no promotional spend, no traffic source, no cost per acquisition, no chatter payroll and no agency split in the same view. We can answer 'did we move volume' but not 'did we make money' or 'where should the next dollar go'.

IF WE HAD A MAGIC WAND

Instrument acquisition end to end — know where every new subscriber came from and what it cost. The largest movement in our month is a sharp fall in new subscribers, and it is undiagnosable with the data we hold.

Where we are stuck or unsure

- Chatter quality spread. A three-day sample showed unlock rates ranging from roughly 6% to nearly 60% across the team. In a business where PPV is over 80% of revenue that spread should be worth a great deal, but three days is not enough to size it or manage anyone on it.
- Top creator softening. She is over half of revenue and down week on week. We cannot tell from the data whether a small number of high-value fans went quiet or whether outbound volume dropped. The two have very different fixes.
- Staff and creator churn. Several creators left within a short window, and on the chatting side the median tenure of leavers is around two weeks. We suspect a systemic onboarding and ramp problem rather than individual fit, but we have no exit data to confirm it.

Input needed, continued

What would help most from the consultant's side.

Video ideas that would help us

IDEA 1

Instrumenting acquisition when you only have platform data. How do agencies attribute new subscribers to a source without ad-platform integration? This is our number one blocker and we suspect it is common.

IDEA 2

Chatter ramp and retention. What does a working onboarding system look like, and what should a new chatter's first 30 days actually contain? Our median leaver lasts about two weeks.

Questions for the consultant

ANALYTICS

What is the standard approach to subscriber-source attribution on OnlyFans when the platform does not expose referrer data? We are flying blind on acquisition.

OPERATIONS

Is a two-week median chatter tenure normal for the industry, or is that an outlier? What is a healthy benchmark to aim at?

SALES

We have documented a stepped-pricing sequence that produced over \$2,200 from a single fan in under 90 minutes, and we can reproduce the pattern in the transaction data. Is this a known play, and are there refinements or guardrails we are missing?
